Thm: (Limit Comparison test - I)

Let $f(x), g(x) \geq 0 \quad \forall\, x \in [a,b)$.

Suppose $\displaystyle\lim_{x \to b^-} \frac{f(x)}{g(x)} = \ell$.

If $\ell \neq 0, \infty$, then $\displaystyle\int_a^b f$ & $\displaystyle\int_a^b g$ converge or diverge together at b.

Proof: Suppose $\ell > 0$. Choose $\varepsilon > 0$ small s.t. $\ell - \varepsilon > 0$.

$\because \displaystyle\lim_{x \to b^-} \frac{f(x)}{g(x)} = \ell$, $\exists\, c \in [a,b)$ s.t.

$$\left| \frac{f(x)}{g(x)} - \ell \right| < \varepsilon \quad \forall\, x \in (c,b).$$

$$\Rightarrow \ell - \varepsilon < \frac{f(x)}{g(x)} < \ell + \varepsilon \quad \forall\, x \in (c,b).$$

$$\Rightarrow (\ell - \varepsilon)\, g(x) < f(x) < (\ell + \varepsilon)\, g(x).$$

$\because \ell - \varepsilon > 0$ & $g(x) \geq 0 \quad \forall\, x$, it follows that

$$0 \leq (\ell - \varepsilon)\, g(x) \leq f(x) \quad \forall\, x \in (c,b).$$

$\therefore$ By Comparison test, if $\displaystyle\int_a^b f$, or equivalently, if $\displaystyle\int_c^b f$ converges at b, then $(\ell - \varepsilon)\displaystyle\int_c^b g$, or equivalently, $(\ell - \varepsilon)\displaystyle\int_a^b g$ converges at b. $\Rightarrow \displaystyle\int_a^b g$ converges at b.

Now suppose $\int_a^b g$, or equiv., $\int_c^b g$ Converges at b.

Again by $f(x) < (l+\varepsilon)\, g(x)$ $\forall\, x \in (c, b)$ &

by the Comparison test, it follows that $\int_a^b f$ Converges at b.

$\therefore$ $\int_a^b f$ Converges at b $\Longleftrightarrow$ $\int_a^b g$ Converges at b.

IIly; $\int_a^b f$ diverges at b $\Longleftrightarrow$ $\int_a^b g$ diverges at b.

$\boxed{//}$

eg: (1) $\displaystyle\int_0^1 \frac{\sin x}{x^2}\, dx$. $\longleftarrow$ An I.I. at $x = 0$.

Set $f(x) = \dfrac{\sin x}{x^2}$ & $g(x) = \dfrac{1}{x}$.

$$\therefore \frac{f(x)}{g(x)} = \frac{\sin x}{x}.$$

Now $\displaystyle\lim_{x \to 0^+} \frac{f(x)}{g(x)} = \lim_{x \to 0^+} \frac{\sin x}{x} = 1 > 0.$

But $\displaystyle\int_0^1 g = \int_0^1 \frac{1}{x}\, dx$ diverges. $\longleftarrow$ Why?

$\therefore$ By Limit Comparison test, $\displaystyle\int_0^1 \frac{\sin x}{x^2}\, dx$ diverges.

(2) $\displaystyle\int_0^1 \frac{e^{\sqrt{x}} - 1}{x}\, dx$. $\longleftarrow$ I.I. at $x = 0$.

Set $f(x) = \dfrac{e^{\sqrt{x}} - 1}{x}$ & $g(x) = 1/\sqrt{x}$.

$$\therefore \frac{f(x)}{g(x)} = \frac{\sqrt{x}\,(e^{\sqrt{x}} - 1)}{x} = \frac{\sqrt{x}\,(\sqrt{x} + h(x) \times x)}{x}.$$

why?

$\longrightarrow 1$ as $x \to 0^+$.

$\int \frac{1}{x^p}$, $\cancel{p < 1}$

Jaydeb Sarkar.

$\because \int_0^1 \frac{1}{\sqrt{x}}\,dx$ Converges, by Limit – comparison test,

$$\int_0^1 \frac{e^{\sqrt{x}}-1}{x}\,dx \quad \text{converges.}$$

$\boxed{\mathbb{Z}}$

(3) $$\int_1^2 \frac{x^2+x+1}{(x^2-1)^{1/3}}\,dx.$$

$$f(x) := \frac{x^2+x+1}{(x^2-1)^{1/3}} \longleftarrow \text{~~Rational fn.~~}$$

$$g(x) := \frac{1}{(1-x)^{1/3}}. \longleftarrow \because \text{ We can deal with } \frac{1}{x+1} \text{ factor.}$$

$$\therefore \lim_{x\to 1^+} \frac{f(x)}{g(x)} = \lim_{x\to 1^+} \frac{(x^2+x+1)}{(x+1)^{1/3}} = \frac{3}{2^{1/3}} > 0.$$

$$\text{Now} \quad \int_1^2 g = \int_1^2 \frac{1}{(1-x)^{1/3}}\,dx$$

$$= \int_0^1 \frac{1}{x^{1/3}}\,dx \longleftarrow \begin{cases} 1-x \longmapsto x. \\ \Rightarrow 1 \longrightarrow 0 \\ \& \ 2 \longrightarrow 1 \end{cases}$$

$\because p = \frac{1}{3} < 1$, $\int_1^2 g$ Converges.

$$\Rightarrow \int_1^2 \frac{x^2+x+1}{(x^2-1)^{1/3}} \quad \text{Converges.}$$

$\boxed{\mathbb{Z}}$

Def: An I.I. $\int_a^b f$ is said to be absolutely convergent if the I.I. $\int_a^b |f|$ is convergent.

Thm: Absolute convergent $\Rightarrow$ convergent.

Q: "$\Leftarrow$"? ??

$\int_{-1}^{1} \frac{1}{x}\,dx$

Proof. Let $\int_a^b f$ be an I.I. at $x = a$.

Now $-|f(x)| \leq f(x) \leq |f(x)| \quad \forall\, x \in (a,b]$.

$\Longrightarrow \quad 0 \leq f(x) + |f(x)| \leq 2|f(x)| \quad \forall\, x \in (a,b]$.

$\because$ the I.I $\int_a^b |f|$ is ~~absolutely~~ conv. at a, by comparison ~~test~~, it follows that

$$\int_a^b \left(f(x) + |f(x)| \right) dx \quad \text{converges.}$$

Finally, $\forall\; a < c < b$, we have:

$$\int_c^b f = \int_c^b \left(\left(f(x) + |f(x)|\right) - |f(x)| \right) dx$$

$$= \int_c^b \left(f(x) + |f(x)|\right) dx - \int_c^b |f(x)|\,dx$$

(~~if both I.I. exist~~)

$\because \int_a^b \left(f(x) + |f(x)|\right) dx$ & $\int_a^b |f(x)|\,dx$ both exists, it follows that

Jaydeb Sarkar

$\int_a^b f$ also exists. $\boxed{\angle\!/}$

eg: (Recall from page 72).

~~$\int_0^1 \frac{\sin x}{x^2} \, dx$.~~

~~$\because \left| \frac{\sin x}{x^2} \right| \geq |\sin x| \quad \forall x \in (0,1]$~~

~~& $\int_0^1 |\sin x| \, dx$ is convergent, it follows that~~

~~$\int_0^1 \frac{\sin x}{x^2}$ is A.C. & hence convergent.~~ $\boxed{\angle\!/}$

— » —

Def: (I.I. of type II):

Fix $a \in \mathbb{R}$ & Suppose $f \in \mathcal{R}[a, r]$ $\forall r > a$.

If $\lim_{r \to +\infty} \int_a^r f$ exists, then we say that

$\int_a^{\infty} f$ Converges & we write:

$$\int_a^{\infty} f = \lim_{r \to +\infty} \int_a^r f.$$

If $\lim_{r \to +\infty} \int_a^r f$ diverges, then we say $\int_a^{\infty} f$ diverges.

Illy: $\displaystyle\int_{-\infty}^{b} f = \lim_{r\to-\infty} \int_{-r}^{b} f$. ⟵ if converges.

Assumes $f \in \mathcal{R}[-r, b]$ $\forall$ $r>0$, $-r<b$

$-r \quad b$ $\quad r>0$

~~Def: $\displaystyle\int_{-\infty}^{\infty} f := \int_{-\infty}^{c} f + \int_{c}^{\infty} f$~~

~~whenever the~~ R.

Def: Let $f \in \mathcal{R}[a,b]$ $\forall$ $a<b$ in $\mathbb{R}$. If $\exists$ $c \in \mathbb{R}$ s.t. both $\displaystyle\int_{-\infty}^{c} f$ & $\displaystyle\int_{c}^{\infty} f$ converge, then we say that $\displaystyle\int_{-\infty}^{\infty} f$ converges & write

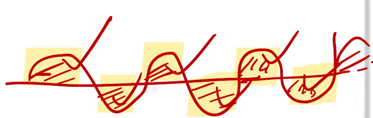
$$\int_{-\infty}^{\infty} f = \int_{-\infty}^{c} f + \int_{c}^{\infty} f . \quad \text{———} \quad (*)$$

HW: If $\displaystyle\int_{-\infty}^{\infty} f$ converges, then $(*)$ is independent of the choice of $c \in \mathbb{R}$.

$\boxed{1-1+1-1+1-\cdots = 0 \ ?}$ ×

eg: ① $\displaystyle\int_{0}^{\infty} \sin x \, dx.$ Let $f(x) = \sin x$. $x \in [0, \infty)$.

Note that $f \in \mathcal{R}[0, R]$ $\forall R>0$.



$$\therefore \lim_{R\to\infty} \int_0^R f = \lim_{R\to\infty} \int_0^R \sin x \, dx$$

$$= \lim_{R\to\infty} \left[1 - \cos R \right].$$

But this limit DNE! $\Rightarrow$ $\displaystyle\int_0^\infty \sin x \, dx$ diverges.

OR Does not converges.

Jaydeb Sarkar

② $\int_{-\infty}^{0} e^{-x}\, dx.$

Again, $e^{-x} \in \mathcal{R}[-R, 0] \quad \forall\ R > 0.$

Now, for $R > 0$,

$$\int_{-R}^{0} e^{-x}\, dx = \int_{0}^{R} e^{x}\, dx \qquad [x \longrightarrow -x]$$

$$= e^{R} - 1.$$

$$\therefore \lim_{R \to \infty} \int_{-R}^{0} e^{-x}\, dx = \lim_{R \to \infty} (e^{R} - 1) = \infty.$$

$\therefore \int_{-\infty}^{0} e^{-x}\, dx$ diverges.

③ $\int_{-\infty}^{\infty} \frac{dx}{1+x^2}.$

We observe: $$\int_{0}^{\infty} \frac{dx}{1+x^2} = \lim_{R \to \infty} \int_{0}^{R} \frac{dx}{1+x^2}$$

$$= \lim_{R \to \infty} \left[\tan^{-1}(R) - \tan^{-1}(0) \right].$$

why? $$= \frac{\pi}{2} - 0 = \frac{\pi}{2}.$$

Also, $$\int_{-\infty}^{0} \frac{dx}{1+x^2} = \lim_{R \to \infty} \int_{-R}^{0} \frac{dx}{1+x^2}.$$

$$= \lim_{R \to \infty} \int_{0}^{R} \frac{dx}{1+x^2}. = \frac{\pi}{2}.$$

$$\therefore \int_{-\infty}^{\infty} \frac{dx}{1+x^2} = \pi.$$

$\boxed{\text{II}}$

This is an even fn.

Fact: (HW). Let $a > 0$. Then

$$\int_a^\infty \frac{1}{x^p}\,dx$$

Converges $\forall\, p > 1$ & diverges $\forall\, p \leq 1$.

Notation: For a fixed $a \in \mathbb{R}$, we say $f \in \mathcal{R}[a,\infty)$ if $f \in \mathcal{R}[a,R]$ $\forall\, R > a$.

CAUTION !! We are not saying that f is Riemann integrable.

Thm: (Comparison test - II).

Let $a \in \mathbb{R}$, $f, g \in \mathcal{R}[a,\infty)$ & let

$$0 \leq f(x) \leq g(x) \quad \forall\, x \in [a,\infty).$$

(i) If $\int_a^\infty g$ Converges, then $\int_a^\infty f$ Converges.

(ii) If $\int_a^\infty g$ diverges, then $\int_a^\infty f$ diverges.

Proof: $\because$ $0 \leq f(x) \leq g(x)$ $\forall\, x \in [a,\infty)$ & $f, g \in \mathcal{R}[a,\infty)$, it follows that

$$0 \leq \int_a^t f(x)\,dx \leq \int_a^t g(x)\,dx \quad \forall\, t > a.$$

Set $F(t) := \int_a^t f(x)\,dx$ & $G(t) := \int_a^t g(x)\,dx$. $\forall\, t > a$.

$\therefore$ $F, G \in C(a,\infty)$ & monotonically increasing.

The result now follows immediately.

(Cont. of F & G is not needed).

$\blacksquare$
